

Hearing Aids

As independent hearing consultants we are able to offer you the choice of the best brands available. Our extensive portfolio includes devices that connect to Bluetooth, have sophisticated directional capability and link to accessories such as TV streamers. We offer rechargeable options, with some aids only needing to be charged for seconds, yet last for hours.

Thanks to miniaturisation of electronics, the use of different materials such as titanium,

and a continuing focus on personal style and design, slimline hear-wear and invisible models are readily available, in a wide range of colours to match your lifestyle and image.

The logo consists of a blue stylized 'C' shape that curves around the text. The text 'Help in Hearing' is in a bold, sans-serif font, and 'For us, it's personal' is in a smaller, italicized sans-serif font below it.
Help in Hearing
For us, it's personal

Totally Invisible (Lyric)

The Phonak Lyric is the world's first and only 100% invisible aid. Placed entirely inside the ear canal, it requires no daily changing/insertion, no batteries, no filters and is sweat-proof, shower-proof, remaining in place 24 hours a day, 7 days a week, for months at a time.

Completely in the Canal (CIC)

CIC are small custom made hearing aids, fitting deeply and entirely within the ear canal. They fit mild to moderately severe hearing losses and offer high cosmetic appeal as they are nearly invisible when worn.

Invisible in Canal (IIC)

IIC devices are smaller than the CICs, fit deeper in the ear, completely out of view past the second bend of the ear canal, providing an invisible fit, suitable for mild to moderate hearing losses.

In The Canal (ITC)

ITC devices sit in the ear canal entrance. Slightly larger than CIC's they have a longer battery life and host additional features such as directional microphones. They fit mild, moderate and up to severe hearing losses.

In The Ear (ITE)

ITE's feature a full shell fitting that sits flush within the outer ear bowl. With a greater capacity, they have additional controls and features such as directional microphones and loop systems. A larger receiver gives enough power for severe to profound hearing losses.

Receiver In The Ear (RITE)

RITE's hide behind the ear, with fine, transparent wires discreetly allowing natural airflow around the tip while routing the sound through the tip. RITEs are ideal for first time users and high frequency losses but can be used for severe and profound losses, with custom made ear moulds.

Behind The Ear (BTE)

BTE's fit behind the ear, and have transparent tubing which is usually connected to custom built, clear ear moulds. They are recommended for severe to profound hearing losses.

*We're here to help,
to us it's personal.*
